#### Trademarks

CompactLogix, ControlLogix, & PLC-5 are registered trademarks of Rockwell Automation, Inc.

EtherNet/IP is a trademark of the ODVA.

MicroLogix, RSLogix 500, and SLC are trademarks of Rockwell Automation, Inc.

Microsoft, Windows, and Internet Explorer are registered trademarks of Microsoft Corporation.

All other trademarks and registered trademarks are the property of their holders.

#### Limited Warranty

Real Time Automation, Inc. warrants that this product is free from defects and functions properly.

EXCEPT AS SPECIFICALLY SET FORTH ABOVE, REAL TIME AUTOMATION, INC. DISCLAIMS ALL OTHER WARRANTIES, BOTH EXPRESSED AND IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR APPLICATION. THIS LIMITED WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS. YOU MAY ALSO HAVE OTHER RIGHTS, WHICH VARY FROM STATE TO STATE.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular application, Real Time Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams. Except as specifically set forth above, Real Time Automation and its distributors and dealers will in no event be liable for any damages whatsoever, either direct or indirect, including but not limited to loss of business profits, income, or use of data. Some states do not allow exclusion or limitation of incidental or consequential damages; therefore, the limitations set forth in this agreement may not apply to you.

No patent liability is assumed by Real Time Automation with respect to use of information, circuits, equipment, or software described in this manual.

#### Government End-Users

If this software is acquired by or on behalf of a unit or agency of the United States Government, this provision applies: The software (a) was developed at private expense, is existing computer software, and was not developed with government funds; (b) is a trade secret of Real Time Automation, Inc. for all purposes of the Freedom of Information Act; (c) is "restricted computer software" submitted with restricted rights in accordance with subparagraphs (a) through (d) of the Commercial "Computer Software-Restricted Rights" clause at 52.227-19 and its successors; (d) in all respects is proprietary data belonging solely to Real Time Automation, Inc.; (e) is unpublished and all rights are reserved under copyright laws of the United States. For units of the Department of Defense (DoD), this software is licensed only with "Restricted Rights": as that term is defined in the DoD Supplement of the Federal Acquisition Regulation 52.227-7013 (c) (1) (ii), rights in Technical Data and Computer Software and its successors, and: Use, duplication, or disclosures is subject to restrictions as set forth in subdivision (c) (1) (ii) of the Rights in Technical Data and Computer Software clause at 52.227-7013. If this software was acquired under GSA schedule, the U.S. Government has agreed to refrain from changing or removing any insignia or lettering from the Software or documentation that is provided or from producing copies of the manual or media. #### **Overview**

This document explains and provides examples of the basic ladder logic required for the 435NBX/490NBX to communicate with an Allen-Bradley PLC.

## 435NBX/490NBX ASCII Setup

**ASCII to ControlLogix:** In this example a barcode reader is scanning 82 characters. That string will be transferred to the PLC Tag Name RSLogix5000: RTA\_read with the data type of a string. For the RS500 example the Tag/File name would be ST10:0.

ASCII to PLC PLC to ASCII State Communications	Port 0 ASCII Configuration

**ControlLogix to ASCII:** In this example 82 characters of data from the PLC Tag Name RSLogix5000: RTA\_write will be sent to the ASCII device.

For the RS500 example the Tag/File name would be ST11:0.

# RSLogix 5000 Tag Setup

Expand the **USER DEFINED Controller** folder. For this example we are using Controller folder rta\_test. In the Controller Tags list, create the two tags that are assigned in the gateway. The Name and Data Types must match those set up in the gateway or an error will occur.

# **RSLogix 5000 Ladder Logic Examples**

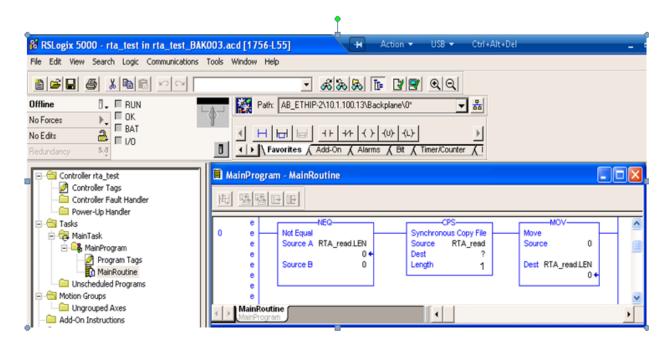

## ASCII to PLC Direction

**ASCII to ControlLogix Logic** : This rung will zero out the **RTA\_read.LEN** tag when the tag **RTA\_read** is populated by the CPS instruction.

For diagnostic purposes, a counter can be added to monitor when the .LEN field does not get cleared out. The value of that counter should match the **Wr ASCII Msg to PLC** counter on the Diagnostics page of the gateway.

The **?** in the CPS instruction represents a user defined tag location that will receive the ASCII data from the RTA\_read string.

The gateway will not deliver the next ASCII message to the PLC until the .LEN field for that tag is zeroed out.

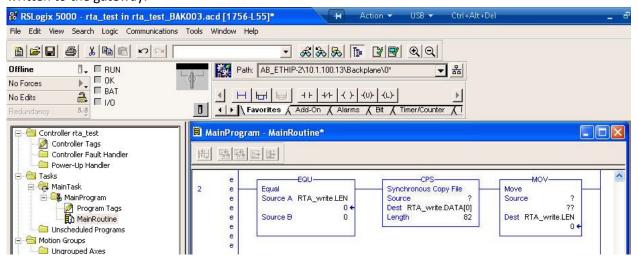

### **PLC to ASCII Direction**

#### ControlLogix to ASCII Logic:

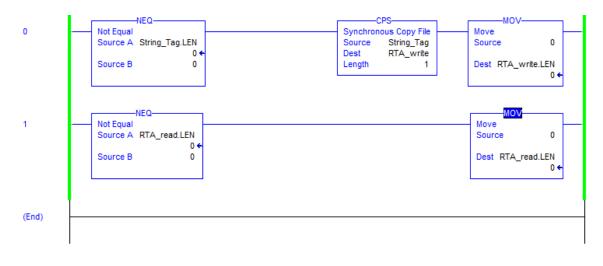

To write data to the gateway, you must copy your message into the user defined tag in two separate instructions. Copy the .DATA part of the message first and then copy the .LEN part second. If you write the .LEN field first you will likely resend the last message sent.

The source field in the CPS and MOV instructions is the user defined tag that contains the data to be written to the gateway.

## Loopback

**Loopback Logic:** This Logic is demonstrating a write from the PLC to ASCII direction which then loops the data back from ASCII to the PLC. Set up the tags in both directions for Port 0. For this example to work, connect a null modem cable to Port 0 and on the other end short out pins 2 and 3. Use the String\_Tag to enter in the data from the PLC that will be copied to the RTA\_write tag, which will then be sent out Port 0 of the gateway, and looped back to the RTA\_read tag.

# RSLogix 500 Tag Setup

Expand the **Data Files** folder and create the two files that are assigned in the gateway. The Name and Data Types must match what is set up in the gateway.

## **RSLogix 500 Ladder Logic Examples**

**ASCII to PLC Logic** : This rung will zero out the **ST10:0.LEN** file when the file **ST10:0** is populated by the CPS instruction.

For diagnostic purposes, a counter can be added to monitor when the .LEN field does not get cleared out. The value of that counter should match the **Wr ASCII Msg to PLC** counter on the Diagnostics page of the gateway.

The **ST11:0** Dest field in the CPS instruction represents a user defined file location that will receive the ASCII data from the **ST10:0** string.

The gateway will not deliver the next ASCII message to the PLC until the .LEN field for that file is zeroed out.
